

CHEMICAL LISTING

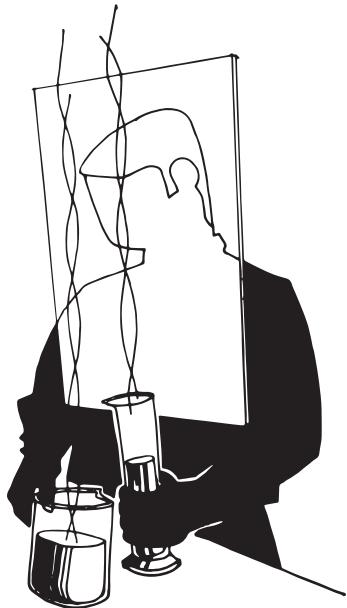

ERLAB'S LIST OF APPROVED CHEMICALS

RETENTION CAPACITIES FOR ERLAB FILTERS

TO PROTECT

Erlab is the inventor and world leader in laboratory-grade chemical filtration products.

This edition of the **Chemical listing booklet** has been developed by **Erlab's R&D laboratory**. It is the **result of 50 years of research and development into filtration technologies** and demonstrates the expertise of Erlab's R&D laboratory in the field of molecular and particulate filtration.

In compliance with **AFNOR NFX 15-211: 2009** Standard, this booklet is supplied with every Erlab ductless filtering fume hood and includes a full list of chemicals certified by Erlab for handling uses.

You may contact Erlab at any time:

- for information regarding chemicals not listed in this booklet
- to ensure you have the latest copy of this Chemical listing
- if you require information related to the handling of your chemicals

CHEMICAL AGENTS

By alphabetical order	14
By formula	66
By CAS number	78

Attention

The retention capacities given in this Chemical listing only apply to Erlab filtered fume hoods with modular filtration columns and their filters, manufactured and marketed by Erlab.

Occupational Exposure Limits (OEL) or Threshold Limit Values (TLV) are specific to each chemical and under no circumstances may be applied to chemical agents when used in a combination. The level of protection provided by Erlab filtered fume hoods is dependent upon compliance with each specific usage condition within the hood which can only be guaranteed through the Erlab Safety Program (ESP).

Therefore, the values given in this Chemical listing may alter in accordance with the latest findings regarding the chemicals included in it:

- OEL or TLV values may be reviewed and corrected by government bodies responsible for establishing them.
- Regulations regarding these chemicals (classification, storage, etc.) are updated in accordance with research and health monitoring authorities.
- Improvement in the performance of carbon filters manufactured by Erlab has a direct effect on retention capacities given in this Chemical listing.

Quantities of chemicals handled in the

enclosure must not exceed those mentioned in this Chemical listing for enclosures complying with the requirements of class 2 of AFNOR NFX 15-211.

According to AFNOR NFX 15-211: 2009 Standard, only handlings which can be interrupted immediately may be carried out in class 2 enclosures. Therefore, the fume hood filter must be replaced as soon as any chemical is detected downstream of the filter.

The Erlab Safety Program has been set up to guarantee your safety. We would like to remind you that the chemical usage, filter type and method of detection must be validated before this apparatus is used for the first time and each time the application is changed.

Handling CMR Agents (Carcinogenic Mutagenic Reprotoxic)

Strict regulations to protect people exposed to CMR agents at their workstation are laid out by the French Labor Code. These regulations only apply to Category 1A and 1B CMR agents, as Category 2 CMR agents are not governed by these regulations.

Safety regulations are extremely demanding but at the same time pragmatic, in that they suggest alternative solutions allowing in particular the use of filtering hoods, on condition that they reduce exposure to the

product to the lowest level possible.

Labor safety code requires that the following measures be taken if CMR agents are present (categories 1A or 1B):

- Regular risk assessment represented by each CMR agent.
- If it is not possible to replace a CMR agent with a non-CMR agent, the CMR agent must be handled in a closed system.
- If it is impossible to use a closed system, exposure to CMR agents must be reduced to the lowest possible levels.
- Work must be stopped when exposure to a CMR agent reaches the occupational exposure limit or TLV.

AFNOR NFX 15-211 sets minimum rules to ensure that a fume hood used by an operator performs at a high level (release into the room at a concentration less than 1% of the occupational exposure limit or TLV).

To avoid interfering with the current laws and regulations, AFNOR NFX 15-211 does not apply to CMR agents Category 1A and 1B. Category 2 CMR agents are governed by AFNOR NFX 15-211.

The purpose of the Labor Code and AFNOR NFX 15-211 is to reduce exposure to the lowest possible level.

AFNOR NFX 15-211: 2009 Standard

The AFNOR NFX 15-211: 2009 Standard was established by the Union de Normalisation de la Mécanique (UNM), composed of a team of experts (INRS, government bodies and professional unions), mandated by AFNOR. This standard applies to filtering fume hoods (also known as recirculating fume cupboards or ETRAF) designed for research work, analysis, teaching, etc. for all laboratories in which chemicals subject to occupational exposure limits (OEL or TLV-TMA) are handled. This text requires performance criteria relating to:

- **Filtration efficiency**
- **Containment efficiency**
- **Air face velocity**

Therefore, a list of approved chemicals for our filters and **a specific user manual must be provided** with filtering fume hoods.

The classes established by the standard

Class 1	Class 2
Filtering fume hood with safety reserve	Filtering fume hood without safety reserve
A main filtering level and a safety filtering level	One level of filtration

Classification according to the type of filtration

	Filtration type according to AFNOR NFX 15-211:2009	Equivalent Erlab filtration type
Particle filtration*	Type P	HEPA
Vapor filtration**	Type V	AS - BE+ - F - K
Particle and vapor filtration* *	Type PV	HEPA AS - HEPA BE+ - HEPA F - HEPA K

*: the particle filter must be at least type H14 in accordance with standard NF EN 1822-1

**: vapor filters must undergo two successive tests using cyclohexane and isopropanol for filters designed to capture Volatile Organic Compounds (VOC). Another test designed for acid vapors is performed with hydrochloric acid.

Filtration efficiency (see description of the test method on page 8)

Filtration efficiency is defined by the capacity of the filter to capture dangerous molecules handled inside the enclosure and determines the quality of air filtered downstream of the filter.

	Class 1	Class 2
Normal operating phase	Normal operating phase during which the concentration downstream of the filters must be less than 1% of the OEL	
Detection phase	Detection phase during which the concentration downstream of the filters must be less than 1% of the OEL and failing filtration indication	Detection phase during which the concentration downstream of the filters must be less than 50% of the OEL
Safety phase	Safety phase during which the concentration downstream of the filters must be less than 50% of the OEL, and that must not be less than 1/12 of the duration of the normal operating phase	

For class 2, the quantity of chemicals handled in the hood cannot exceed 1/8 of the filter retention capacity of chemicals.

Enclosure containment efficiency

Containment efficiency is determined by the ability of the hood to keep the fumes or particles inside the enclosure preventing their release into the laboratory environment.

To prove this efficiency, a test is performed according to the protocol described in the AFNOR NFX 15-211.

Test procedure: SF₆ tracer gas (sulfur hexafluoride) is released into the enclosure and a grid holding sensors is placed opposite the handling ports. Samples are then taken on the grid.

On the basis of gas concentrations released and samples taken that will allow the average exposure of an operator to this tracer gas to be calculated, it is possible to establish a level of containment performance for the fume hood. The containment threshold set by standard AFNOR NFX 15-211: 2009 imposes a maximum SF₆ concentration level of 0.1 ppm at the measuring points on the grid.

Air face velocity

Air face velocity is described as the ability of the hood to create a dynamic barrier between the operator and the handling.

For fume hoods with fixed front panels, the air face velocity at all of the openings must be between 0.4 and 0.6 m/s. Therefore, they must be equipped with a device to continuously monitor ventilation which is also an indicator of good containment.

Erlab Molecular filters

Quality design

Erlab guarantees that users of our filtering fume hoods and storage cabinets are working with a high quality product composed of the following:

- Each filter is designed so that the density of the carbon within it remains constant over time (US patent 4946480).
- Total control of negative wall effects (US patent 4946480).
- A stable, uniform adsorption column.
- Each filter is packaged in a sealed plastic bag identified by a serial number and manufacture date to guarantee it is in perfect working condition upon delivery.

Compliance with filtration standards

The design of our filters guarantees total protection. Inspired in part by military-type gas mask technology, our filters have been subject to rigorous testing and meet all safety requirements set forth by the following filtration standards:

- ASTM (American Standard Test Method) standard: This standard pertains to carbon as a raw material used in the design of filtration cartridges. It is an evaluation standard that pertains only to the quality of the raw material. It thus allows Erlab to select high-performance carbons.
- AFNOR (French standardization organization) standard NF X 15-211: This standard guarantees the filtration performance of the filters used in our units. It sets forth requirements regarding the air quality downstream from the filter. This level of quality is proven through tests carried out by an independent laboratory, these tests demonstrate the filtration quality of our filters.

Types of filters available for all of our product lines

The type of filter recommended is specific to the type of chemicals being handled and allows users to benefit from high retention capacities for the following:

Type of Filter	For Use With
BE+	Inorganic acids and Solvent vapors
AS	Organic vapors
F	Formaldehyde vapors
K	Ammonia vapors
HP	HEPA H14 for powders
Prefilter	Hepa H14 or BE+, AS, F, K

Erlab filter performance tests

Erlab filters are subject to performance tests conducted in accordance to the requirements of the AFNOR NFX 15-211: 2009 Standard. The results of the tests given in this list of approved chemicals demonstrates the technological performance developed by Erlab.

The fume hood that the tests were performed in was fitted with new filters and installed in a closed space. The chemical used for the test was evaporated in the fume hood to give a constant concentration during all operating phases stated in the standard.

The three chemicals selected for the Erlab filter performance tests were:

- Isopropanol
- Cyclohexane
- Hydrochloric acid

The concentration of the chemical downstream of the filtration system was checked at least three times per hour during all the filtering fume hood operating phases and was expressed in ppm by volume.

The maximum values of the reference chemicals are given in the list of approved chemicals provided with every Erlab filtered fume hood.

The test was performed in 8 hour sequences, 16 hours apart.

The Analyzers

Whatever the chemical being tested, the analysis procedure was adapted so as to obtain a detection threshold of less than 1% of the occupational exposure level or TLV.

The procedure can be one of those described below or any other equivalent method:

- The concentrations of hydrochloric acid in the air were sampled by capturing a known volume of air on a cartridge impregnated with a buffer solution of Na CO /NaHCO . The samples prepared in this way were analyzed by ion chromatography (IC).
- The concentrations of organic gas were sampled by capturing a known volume of air on a cooled cartridge of adsorbent Tenax and active carbon. The samples prepared in this way were analyzed by gas chromatography (GC-FID) after thermal desorption.

The sample prepared in this way was then desorbed by a solution of carbon disulphide (CS) before being analyzed using a gas chromatograph (GC) equipped with a suitable detector (FID).

Test procedure

The tests were carried out at (20 ± 2) °C with a relative humidity between 40% and 70%.

The filtering fume hood being tested was placed in a closed test enclosure with an interior volume between 10 and 50 times the internal volume of the filtering fume hood.

The difference between the temperature inside the filtering fume hood and the temperature of the test enclosure must not exceed 5°C.

The chemical used for the test was introduced using a peristaltic pump, drop by drop, into a heated recipient in the center of the worktop in the filtering fume hood being tested. The system was set so as to produce the desired concentration to more or less 10% in the filtering fume hood for the whole duration of the test.

When necessary, the recipient was heated to slightly more than the boiling point of the test chemical in order to ensure instant evaporation.

Diagram of the test assembly (Evaporation and air sampling principle)

The air is sampled in three zones according to a procedure to be adapted according to the measurement protocol adopted:

- Zone 1: During the whole test, air is regularly sampled 30 cm downstream of the filtering system to check the purifying performance of the filtering fume hood being tested.
- Zone 2: As soon as the test begins, (when the evaporation concentration is stable) the air is sampled inside the fume hood, 30 cm upstream of the filtering system to check that the concentration released before the filters has evaporated.
- Zone 3: A few minutes after the beginning of the test, the air is sampled in the breathing zone to check that the concentration is less than 1% of TLV.

All of the necessary precautions must be taken during the test to avoid anything affecting the air samples between the sampling zone and the analyzer. Sampling must be carried out so as to provide a measurement result that is representative of the air analyzed (e.g. by using multipoint sampling grids).

Normal operating phase

The concentration of the chemical used for the test downstream of the filter must not exceed 1% of the authorized Occupational Exposure Limit or TLV. The evaporation must last for

the entire quantity of the chemical considered (given in the list of approved chemicals supplied by Erlab)

Detection phase

The concentration of the chemical used for the test downstream of the filter must not exceed 1% of the authorized Occupational Exposure Limit for class 1 filtering fume hoods and 50% of the authorized occupational exposure limit for class 2 filtering fume hoods.

Safety phase (for class 1 apparatus)

The concentration of the chemical used for the test downstream of the filter must not exceed 50 % of the authorized Occupational Exposure Limit. This phase must not be less than 1/12 of the duration of the normal operating phase.

Erlab's research and filtration testing laboratory

Filtration test reports

The test report for each test performed must indicate:

- the reference of the test (name of the laboratory performing the test and date completed)
- the volume of the test enclosure that the filtering fume hood is placed in, the type and the reference of the filtering fume hood being tested
- the type and reference of the filtering fume hood being tested
- the type and reference of the filter(s) in the filtering fume hood being tested
- the nature of the chemical used for the test

The report for each phase of the test must indicate:

- Duration in hours
- Weight of the chemical(s)
- The concentration of the chemical used for the test in ppm by volume of air extracted.

Efficiency test certificate

The retention capacities recorded during the tests demonstrates the technological performance developed by Erlab.

These results guarantee users of Erlab filtration products the highest level of protection.

Example of a test performed on a Captair Smart 714 fume hood, equipped with class 1 BE+ filters.

Isopropanol	Cyclohexane	HCl (37%)
2480 g	3544 g	8812 g

The Erlab Difference - Our commitment to your safety

The air exhausted from our filters is so pure that we guarantee your safety. We make this guarantee because the following ingredients are built into every product - without all of them, your health and safety are compromised.

~ Stéphane Hauville
President & CEO

We need to be the best to keep you safe.

We invest in a state-of-the-art lab with top-notch engineers and chemists that are experts in molecular filtration with access to sophisticated analytical equipment that allows us to determine and optimize the retention capacity of our filters.

We continually work to ensure that our products are safe, improve the quality and technology of our products, and develop new products to offer greater protection for laboratory personnel.

Chemical Assessment for your chemical handlings

Assurance that a ductless hood is safe for you. We won't sell a hood without verifying that it is right for your chemical handlings. Your specific chemical handlings are analyzed by our in-house test laboratory. We determine if your chemical handlings can be done safely using our hood and filters. If yes, we let you know the most efficient filter type that is needed, the filter lifetime, and the best method of failing filtration indication.

Certificate of validation

It is important to know what chemicals your hood can handle. A certificate that gives the precise details of the chemicals to be used, the filter type, and an estimation of the filter life expectancy is provided. This informs the user which chemicals are approved for use in the hood.

Erlab Services

It is important that a safety specialist from the manufacturer regularly follows up with you to be sure the hood is in proper working order, check if any chemicals used in the hood have changed, and inform you when your filters need replacement.

We must be liable for your safety.

We must put it in writing.

We guarantee your safety for life.

Definitions of the column headings

The content of the various lists of chemicals given in this Chemical listing may differ from one table to another according to the relevance of the information linked to a specific chemical.

Chemical name: standard name or brand name of the chemical. For chemical names followed by an ®, the brand names have been registered by their owners

Formula: empirical chemical formula

CAS number (Chemical Abstract Standard Number): unique registration number of a chemical given by the American Chemical Society.

Suitable filter: the type of Erlab filter suitable for handling the chemical and/or providing the highest retention capacity:

- AS: Organic vapors
- BE+: Inorganic acids and Solvent vapors
- F: Formaldehyde vapors
- K: Ammonia vapors
- HEPA: Powders 0.1 micron or higher
- PF: Prefilter to protect Hepa and/or Molecular Filters

1C column type: filter retention capacity for the chemical, expressed in grams, during the normal operating phase described in AFNOR NFX 15-211: 2009, class 2

2C column type: filter retention capacity for the chemical, expressed in grams, during the normal operating phase described in AFNOR NFX 15-211: 2009, class 1

VP (Vapor Pressure): saturation vapor pressure at room temperature. Temperature is given in the corresponding box if data is not given at room temperature

MM: molar mass

Boiling point: The highest temperature a substance can reach before evaporating freely, expressed in °C at a pressure of 1 atmosphere

NIOSH 8h: American average limit values established by the National Institute for Occupational Safety and Health

France 8h: French average limit values established by the French Labour Ministry and published by the French INRS

AGS 8h: German average limit values established by the Deutsche Forschungsgemeinschaft

DFG 8h: German average limit values established by the Ausschuss für Gefahrstoffe

Japan 8h: Japanese average limit values established by the Japan Society for Occupational Health

China 8h: Chinese average limit values established by the GBZ 2.1-2007 – Occupational exposure limits for hazardous agent in the

workplace

UK 8h: United Kingdom limit values established by the Health and Safety Executive.

European union 8h: European average limit values established by the Scientific Committee for Occupational Exposure Limits to Chemical Agents.

Detection:

- Manual method of detection involving sampling the air in the detection chamber and analyzing it using a colorimetric detection tube. Please refer to the various manufacturer catalogs to ensure that the fields of analysis of the tubes are able to detect the concentrations allowing a result to be obtained that corresponds to the thresholds set by AFNOR NFX 15-211:2009. The box is checked if the tube exists.
- Sensor: Automatic method of detection. This equipment is required by class 1 of AFNOR NFX 15-211. The box is checked if the alarm can detect the relevant chemical. 3 versions of sensors are available : A for acids, F for formaldehyde and S for VOC (Volatile Organic Compounds).

KOH	CAUSTIC POTASH	Ni	NICKEL METAL AND OTHER COMPOUNDS (AS NI)
KOH	POTASSIUM HYDRATE	O ₂ Sn	TIN(IV) OXIDE (AS SN)
KOH	POTASSIUM HYDROXIDE	O ₃	OZONE
K(Mg, Fe)3AlSi ₃ O ₁₀ (F, OH) ₂	MICA (CONTAINING LESS THAN 1% QUARTZ)		

Formula	Chemical name
OsO ₄	OSMIUM TETROXIDE (AS OS)
Pt	PLATINUM
Si	SILICON
SiO ₂	QUARTZ
SiO ₂	SILICA GEL
SiO ₂	SILICA, AMORPHOUS
Sn	TIN (INORGANIC COMPOUNDS, AS SN)
TiO ₂	TITANIUM DIOXIDE
W	TUNGSTEN insoluble
ZnO	ZINC OXIDE
50 to 100% of Methanol	GIEMSA STAIN
80 to 100% of Methanol	MAY GRÜNWALD STAIN
85% Nonane/15% trimethylbenzene	NAPHTA 30/60
85% Nonane/15% trimethylbenzene	STODDARD SOLVENT
85% Nonane/15% trimethylbenzene	WHITE SPIRIT
